this is the first single volume about the collapse theories of quantum mechanics which is becoming a very active field of research in both physics and philosophy in standard quantum mechanics it is postulated that when the wave function of a quantum system is measured it no longer follows the schrödinger equation but instantaneously and randomly collapses to one of the wave functions that correspond to definite measurement results however why and how a definite measurement result appears is unknown a promising solution to this problem are collapse theories in which the collapse of the wave function is spontaneous and dynamical chapters written by distinguished physicists and philosophers of physics discuss the origin and implications of wave function collapse the controversies around collapse models and their ontologies and new arguments for the reality of wave function collapse this is an invaluable resource for students and researchers interested in the philosophy of physics and foundations of quantum mechanics
